OCELOT

NETWORK INVENTORY AND
VULNERABILITY ASSESSMENT

EVERY NETWORK HAS DEVICES NOBODY REMEMBERS.

An old NAS in a cupboard, a printer still on its factory firmware, a test server that was never switched off. Each one runs software with published vulnerabilities, and anyone who scans the network can look them up.

The asset list in the spreadsheet stopped matching the network a long time ago, and nobody has the week it would take to redo it by hand.

Ocelot is an appliance you plug into a switch port. It finds every active device it can reach, lists the services each one exposes and checks them against the public CVE database. An agent on the workstations adds the installed software.

Then Ocelot writes the report: what is on the network, what is wrong with it, how serious each finding is and what to do about it. Plugging it in changes nothing on the network.

SOMEONE WILL SCAN YOUR NETWORK.
MAKE SURE YOU DO IT FIRST.

www.exys.swiss

One scan is a snapshot. Ocelot stays connected and scans on a schedule, so a new device or a new vulnerability shows up in the next report instead of the next audit.

Every device gets a risk score, so the patches that matter most are applied first. The history is what an auditor or a data protection review asks for: when each problem was found, and when it went away.

WHAT YOU GET:

INVENTORY

Every active device Ocelot can reach, with its address, MAC vendor, hostname, operating system and open ports. Undocumented devices and wrong configurations turn up in the first scan.

VULNERABILITIES

Each service is matched against CVE data and given a severity. Sensitive devices can be left out so nothing critical is disturbed. For the fixes, EXYS analysts can work through the findings with your team.

INSTALLED SOFTWARE

An agent on each workstation reports the installed applications and their versions, so an outdated browser or PDF reader appears in the same report as an unpatched server.

SCHEDULING AND REPORTS

Several recurring scans, timed to run outside business hours. Ocelot shows an overview as soon as a scan ends, then emails the full report: executive summary, inventory tables, findings with risk levels, technical detail and recommendations.
